# Case Study: Turbulence

2022-10-31

#### Introduction

#### Load Data

```
data_train <- read.csv("data-train.csv")
data_test <- read.csv("data-test.csv")</pre>
```

#### Goals (include in writeup)

:1044.3000

##

Max.

- (1) Prediction: For a new parameter setting of (Re, Fr, St), predict its particle cluster volume distribution in terms of its four raw moments.
- (2) Inference: Investigate and interpret how each parameter affects the probability distribution for particle cluster volumes.

## Exploratory Data Analysis (dont include in writeup, see methodology)

To begin, we will explore the data to ensure it is fit for modelling, determine inital transformations needed of the data, and determine which model we see would best fit the data.

R\_moment\_1 Histogra R\_moment\_2 Histogra R\_moment\_3 Histogra R\_moment\_3 Histogra

These histograms indicate that each R\_moment has distributions that are heavily skewed to the right, because the data has many rows of 0. In R\_moment\_3 and R\_moment\_4, we notice that the maximum values are extremely high, while the medians are much smaller in comparison. This could pose a problem to our analysis, thus we believe it is best then to apply a transformation to these variables in order to obtain more accurate analysis.

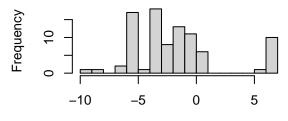

```
par(mfrow = c(2, 2))
hist(log(data_train$R_moment_1), breaks=20, main = paste("Histogram log(R_moment_1)"))
hist(log(data_train$R_moment_2), breaks=20, main = paste("Histogram log(R_moment_2)"))
hist(log(data_train$R_moment_3), breaks=20, main = paste("Histogram log(R_moment_3)"))
hist(log(data_train$R_moment_4), breaks=20, main = paste("Histogram log(R_moment_4)"))
```

# **Histogram log(R\_moment\_1)**

# 8 -7 -6 -5 -4 -3 -2

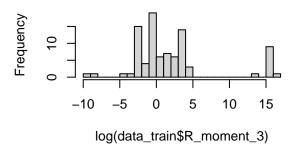

log(data\_train\$R\_moment\_1)

# **Histogram log(R\_moment\_2)**

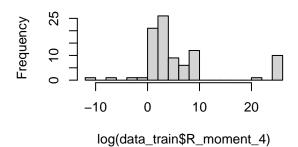

log(data\_train\$R\_moment\_2)

## **Histogram log(R\_moment\_3)**

# Histogram log(R\_moment\_4)

Performing a log transformation on these variables created more normally distributed variables. While not perfectly normal, this is a big improvement to the non-transformed variables. We will use the log version of variables and will reflect these transformed variables as such in our interpretations and analysis.

Another transformation to consider is to turn Fr and Re into ordered, categorical variables, since they each only have 2 or 3 unique values.

(TODO: Figure out how to handle infinite for Fr)

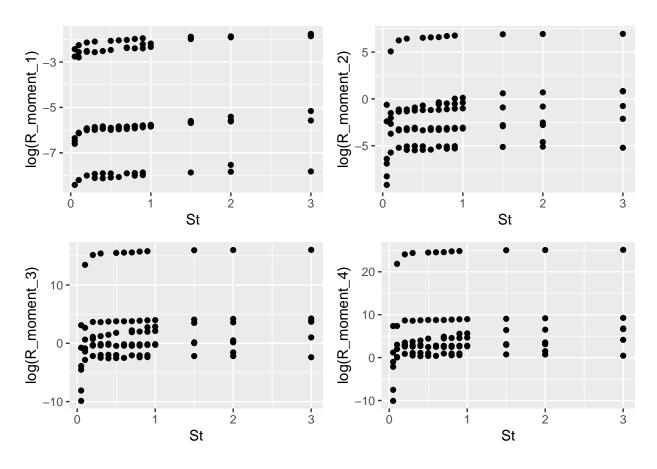

```
p1 <- ggplot(data=data_train, aes(x = St, y=log(R_moment_1))) +
    geom_point()

p2 <- ggplot(data=data_train, aes(x = St, y=log(R_moment_2))) +
    geom_point()

p3 <- ggplot(data=data_train, aes(x = St, y=log(R_moment_3))) +
    geom_point()

p4 <- ggplot(data=data_train, aes(x = St, y=log(R_moment_4))) +
    geom_point()

ggarrange(p1, p2, p3, p4)</pre>
```

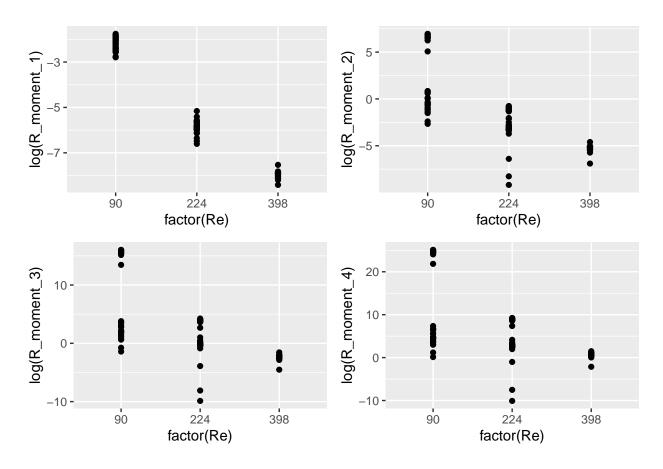

```
p5 <- ggplot(data=data_train, aes(x = factor(Re), y=log(R_moment_1))) +
    geom_point()

p6 <- ggplot(data=data_train, aes(x = factor(Re), y=log(R_moment_2))) +
    geom_point()

p7 <- ggplot(data=data_train, aes(x = factor(Re), y=log(R_moment_3))) +
    geom_point()

p8 <- ggplot(data=data_train, aes(x = factor(Re), y=log(R_moment_4))) +
    geom_point()

ggarrange(p5, p6, p7, p8)</pre>
```

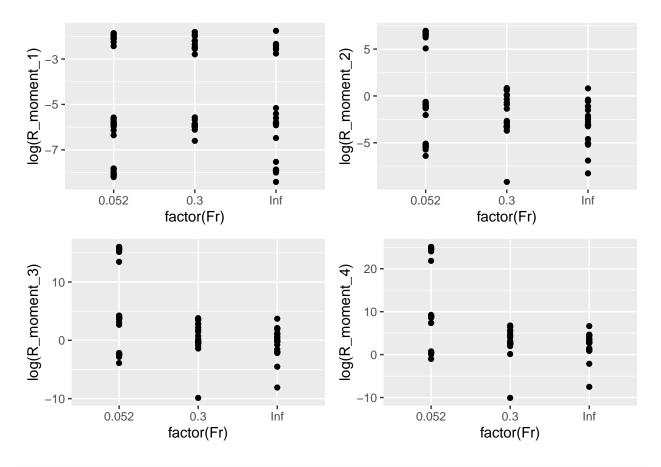

```
p9 <- ggplot(data=data_train, aes(x = factor(Fr), y=log(R_moment_1))) +
    geom_point()

p10 <- ggplot(data=data_train, aes(x = factor(Fr), y=log(R_moment_2))) +
    geom_point()

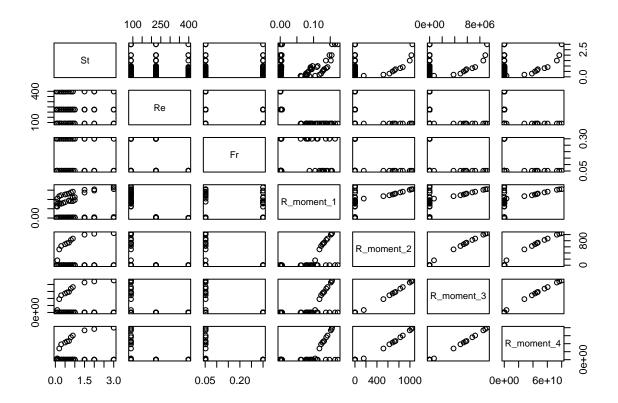

p11 <- ggplot(data=data_train, aes(x = factor(Fr), y=log(R_moment_3))) +
    geom_point()

p12 <- ggplot(data=data_train, aes(x = factor(Fr), y=log(R_moment_4))) +
    geom_point()

ggarrange(p9, p10, p11, p12)</pre>
```

pairs(data\_train)

It appears that each R\_moment variable has somewhat of a linear relationship with St. Thus, we may want to begin our search for a best model by fitting a linear model.

## Modeling

We will fit a basic linear model onto each log-transformed response variable.

```
model1 <- lm(log(R_moment_1) ~ St + factor(Re) + factor(Fr), data=data_train)
summary(model1)</pre>
```

```
##
## Call:
   lm(formula = log(R_moment_1) ~ St + factor(Re) + factor(Fr),

Re and Fr seem to have significant interaction for all moments, while St and Re only have significant interaction for the first moment.

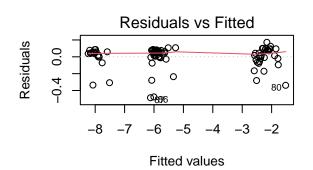

A model with the interaction term for Re and Fr:

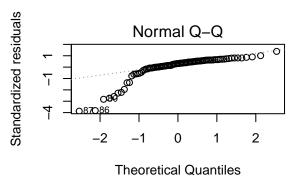

```
glm.interaction <- lm(cbind(log(R_moment_1), log(R_moment_2), log(R_moment_3), log(R_moment_4)) ~</pre>
# summary(qlm.interaction)
glm.interaction
##

#### Polynomial Regression

For each of the four moments, we try to fit a polynomial model based on the degree of the numerical variable, St. We also include the other two factored variables in each model.

First moment:

```
polym1 <- lm(log(R_moment_1) ~ poly(St, 2) + factor(Re) + factor(Fr), data = training)
summary(polym1)</pre>
```

```
##
## Call:
## lm(formula = log(R_moment_1) ~ poly(St, 2) + factor(Re) + factor(Fr),
##
       data = training)
##
## Residuals:
##
        Min
                  1Q
                       Median
                                     3Q
                                             Max
## -0.33265 -0.06610 0.00707 0.07555 0.34096
##
## Coefficients:
##
                 Estimate Std. Error t value Pr(>|t|)
```

Same as linear regression? Polynomial model with degree 7 has lowest MSE, but degree 5 or LSR may be
better based on ANOVA.
Third moment:
```

polym3 <- lm(log(R\_moment\_3) ~ poly(St, 2) + factor(Re) + factor(Fr), data = training)</pre>

summary(polym3)

St doesn't even seem to be a significant predictor in some of these models. Linear regression might not work super well here.

Including all interaction terms:

```
glm.full.models = vector("list",4)
for (i in 1:4) {
  model = lm(log(moments[[i]]) ~ (St + Re + g(Fr))^2, data=data_train)
  glm.full.models[[i]] = model
}
printModels(glm.full.models)
```

Adj R^2	Std Err
0.514	5.387

None of these models are performing well at all, let's try other methods.

# Linear model using least squares & no interaction term

```
model1 <- lm(log(R_moment_1) ~ St + Re + g(Fr), data=training)
pred.lm1 <- predict(model1, testing)
mse_test1 <- mean((pred.lm1 - log(testing$R_moment_1))^2)
model2 <- lm(log(R_moment_2) ~ St + Re + g(Fr), data=training)
pred.lm2 <- predict(model2, testing)
mse_test2 <- mean((pred.lm2 - log(testing$R_moment_2))^2)
model3 <- lm(log(R_moment_3) ~ St + Re + g(Fr), data=training)
pred.lm3 <- predict(model3, testing)
mse_test3 <- mean((pred.lm3 - log(testing$R_moment_3))^2)
model4 <- lm(log(R_moment_4) ~ St + Re + g(Fr), data=training)
pred.lm4 <- predict(model4, testing)
mse_test4 <- mean((pred.lm4 - log(testing$R_moment_4))^2)
mse_test = matrix(c(mse_test1, mse_test2, mse_test3, mse_test4), ncol=4)
colnames(mse_test) = c("MSE 1", "MSE 2", "MSE 3", "MSE 4")
kable(mse_test, digits=3)</pre>
```

MSE 1	MSE 2	MSE 3	MSE 4
0.344	5.274	16.683	34.389

# Linear model using least squares & interaction term

```
model1 <- lm(log(R_moment_1) ~ St + Re*g(Fr), data=training)
pred.lm1 <- predict(model1, testing)
mse_test1 <- mean((pred.lm1 - log(testing$R_moment_1))^2)
model2 <- lm(log(R_moment_2) ~ St + Re*g(Fr), data=training)
pred.lm2 <- predict(model2, testing)
mse_test2 <- mean((pred.lm2 - log(testing$R_moment_2))^2)
model3 <- lm(log(R_moment_3) ~ St + Re*g(Fr), data=training)
pred.lm3 <- predict(model3, testing)
mse_test3 <- mean((pred.lm3 - log(testing$R_moment_3))^2)
model4 <- lm(log(R_moment_4) ~ St + Re*g(Fr), data=training)
pred.lm4 <- predict(model4, testing)
mse_test4 <- mean((pred.lm4 - log(testing$R_moment_4))^2)
mse_test = matrix(c(mse_test1, mse_test2, mse_test3, mse_test4), ncol=4)
colnames(mse_test) = c("MSE 1", "MSE 2", "MSE 3", "MSE 4")
kable(mse_test, digits=3)</pre>
```

MSE 1	MSE 2	MSE 3	MSE 4
0.345	4.897	15.246	31.211

Really bad results, interaction terms aren't helping much. Let's try some other methods other than simple linear regression.

### **Splines**

```
spline1 <- lm(log(R_moment_1) ~ bs(log(St)) + bs(Re) + bs(g(Fr)), data = training)
pred.spline1 <- predict(spline1, testing)
mse_spline1 <- mean((pred.spline1 - log(testing$R_moment_1))^2)
r1=summary(spline1)$adj.r.squared

spline2 <- lm(log(R_moment_2) ~ bs(log(St)) + bs(Re) + bs(g(Fr)), data = training)
pred.spline2 <- predict(spline2, testing)
mse_spline2 <- mean((pred.spline2 - log(testing$R_moment_2))^2)
r2=summary(spline2)$adj.r.squared

spline3 <- lm(log(R_moment_3) ~ bs(log(St)) + bs(Re) + bs(g(Fr)), data = training)
pred.spline3 <- mean((pred.spline3 - log(testing$R_moment_3))^2)
r3=summary(spline3)$adj.r.squared

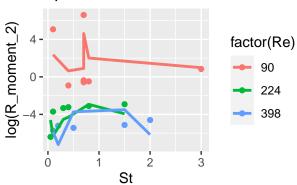

spline4 <- lm(log(R_moment_4) ~ bs(log(St)) + bs(Re) + bs(g(Fr)), data = training)
pred.spline4 <- predict(spline4, testing)</pre>
```

```
mse_spline4 <- mean((pred.spline4 - log(testing$R_moment_4))^2)</pre>
r4=summary(spline4)$adj.r.squared
p1 = ggplot(testing, aes(x = St, y = log(R_moment_1), color = factor(Re))) +
  geom_point() +
  geom_line(aes(x = St, y = pred.spline1), size = 1) +
  labs(title = "Spline Predictions - Moment 1")
p2 = ggplot(testing, aes(x = St, y = log(R moment 2), color = factor(Re))) +
  geom point() +
  geom_line(aes(x = St, y = pred.spline2), size = 1) +
  labs(title = "Spline Predictions - Moment 2")
p3 = ggplot(testing, aes(x = St, y = log(R_moment_3), color = factor(Re))) +
  geom_point() +
  geom\_line(aes(x = St, y = pred.spline3), size = 1) +
  labs(title = "Spline Predictions - Moment 3")
p4 = ggplot(testing, aes(x = St, y = log(R_moment_4), color = factor(Re))) +
  geom_point() +
  geom\_line(aes(x = St, y = pred.spline4), size = 1) +
  labs(title = "Spline Predictions - Moment 4")
spline.graphs = ggarrange(p1, p2, p3, p4, ncol=2, nrow=2)
spline.graphs
```

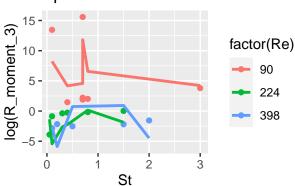

### Spline Predictions – Moment 1

# factor(Re) 90 224 398 St

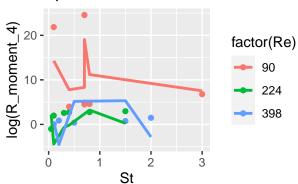

## Spline Predictions – Moment 2

### Spline Predictions – Moment 3

# Spline Predictions – Moment 4

```
mse_spline = rbind(c(mse_spline1, mse_spline2, mse_spline3, mse_spline4), c(r1, r2, r3, r4))
colnames(mse_spline) = c("Moment 1", "Moment 2", "Moment 3", "Moment 4")
rownames(mse_spline) = c("MSE", "Ajd R^2")
```

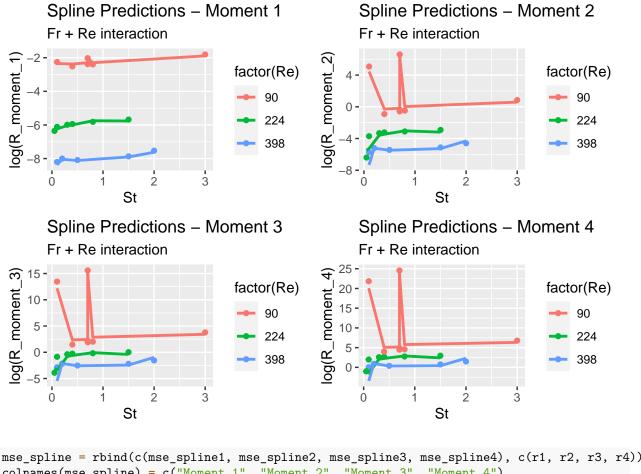

kable(mse\_spline, digits=3)

	Moment 1	Moment 2	Moment 3	Moment 4
MSE	0.021	2.978	9.973	20.672
Ajd R^2	0.997	0.844	0.772	0.741

Splines definitely perform better than linear regression, but still room for improvement.

### Splines with interaction between Fr and Re

```
spline1 <- lm(log(R_moment_1) ~ bs(log(St)) + bs(Re)*bs(g(Fr)), data = training)</pre>
pred.spline1 <- predict(spline1, testing)</pre>
mse spline1 <- mean((pred.spline1 - log(testing$R moment 1))^2)</pre>
r1=summary(spline1)$adj.r.squared
spline2 <- lm(log(R_moment_2) ~ bs(log(St)) + bs(Re)*bs(g(Fr)), data = training)</pre>
pred.spline2 <- predict(spline2, testing)</pre>
mse spline2 <- mean((pred.spline2 - log(testing$R moment 2))^2)</pre>
r2=summary(spline2)$adj.r.squared
spline3 <- lm(log(R_moment_3) ~ bs(log(St)) + bs(Re)*bs(g(Fr)), data = training)</pre>
pred.spline3 <- predict(spline3, testing)</pre>
mse_spline3 <- mean((pred.spline3 - log(testing$R_moment_3))^2)</pre>
r3=summary(spline3)$adj.r.squared
spline4 \leftarrow lm(log(R_moment_4) \sim bs(log(St)) + bs(Re)*bs(g(Fr)), data = training)
pred.spline4 <- predict(spline4, testing)</pre>
mse_spline4 <- mean((pred.spline4 - log(testing$R_moment_4))^2)</pre>
r4=summary(spline4)$adj.r.squared
p1 = ggplot(testing, aes(x = St, y = log(R_moment_1), color = factor(Re))) +
  geom point() +
  geom_line(aes(x = St, y = pred.spline1), size = 1) +
  labs(title = "Spline Predictions - Moment 1", subtitle = "Fr + Re interaction")
p2 = ggplot(testing, aes(x = St, y = log(R_moment_2), color = factor(Re))) +
  geom point() +
  geom_line(aes(x = St, y = pred.spline2), size = 1) +
  labs(title = "Spline Predictions - Moment 2", subtitle = "Fr + Re interaction")
p3 = ggplot(testing, aes(x = St, y = log(R_moment_3), color = factor(Re))) +
  geom_point() +
  geom\_line(aes(x = St, y = pred.spline3), size = 1) +
  labs(title = "Spline Predictions - Moment 3", subtitle = "Fr + Re interaction")
p4 = ggplot(testing, aes(x = St, y = log(R_moment_4), color = factor(Re))) +
  geom_point() +
  geom\_line(aes(x = St, y = pred.spline4), size = 1) +
  labs(title = "Spline Predictions - Moment 4", subtitle = "Fr + Re interaction")
interaction.spline.graphs = ggarrange(p1, p2, p3, p4, ncol=2, nrow=2)
interaction.spline.graphs
```

mse_spline = rbind(c(mse_spline1, mse_spline2, mse_spline3, mse_spline4),	c(r1,	r2,	r3,	r4))
<pre>colnames(mse_spline) = c("Moment 1", "Moment 2", "Moment 3", "Moment 4")</pre>				
rownames(mse_spline) = c("MSE", "Ajd R^2")				
<pre>kable(mse_spline, digits=3)</pre>				

	Moment 1	Moment 2	Moment 3	Moment 4
MSE Aid R^2	0.007 $0.998$	$0.424 \\ 0.970$	1.077 $0.962$	1.895 0.961

Adding the interaction term to the splines makes the performance of this model superior to anything we've used previously (when considering numerical datapoints) based on Adj  $R^2$  and MSE in test validation.

# Methodology (to include in writeup)
